GEN. & REV. DEPTT.
8 AUG 1916

(5) I quite agree with Mr. Balasundaram Iyer as to the necessity of boring tools and improved arrangements for sinking deep wells. The only point on which I differ from him is that I think it will be useless to place such tools and plant in the hands of an Overseer under the District Board. The work should be started in the Department of Industries and regarded as analogous to the work of installing engines and pumps and other machinery.

(6) In the first number of the Mysore Economic Journal I ~~submitted~~ outlined a scheme which might now very well be carried out. I may add that the Department of Industries in Madras have about four power-driven sets of boring tools and about 30 sets of hand tools. The conditions, of course, in Madras are much more favourable than in Mysore. It is, I consider, urgently necessary to take action on these lines and a lump-sum grant of Rs.10,000/- will be required to start work. There will be some difficulty about getting a trained boring engineer to take up this work and enquiries will have to be made. He will require a salary, varying with his experience, of from Rs.100/- to Rs.200/- a month. As all boring work will ~~have to~~ should be paid for, it should be possible to recover the greater part of the expenditure on establishment but the wear and tear on the tools and plant is very heavy and it will be impossible to do any work with a less grant of Rs.300/- a month. credit also being given to such receipts as may be earned.

S P Chatterji

S I R,

Adverting to Government order No.184-95/L.B.12-15-43 dated 8th July 1916 issuing instructions in connection with securing better progress in re the Drinking Water Wells, I have the honor to submit the following points for consideration and early orders:-

1. In this District, the water level is rather low and wells have to be sunk 50' ~~to~~ or 60' if a permanent supply is to be secured. In many cases the top soil to a depth of 20 to 30 feet is soft and collapses very suddenly. The people therefore find it difficult to dig the well to a sufficient depth before the sides collapse. If the sides collapse the surface excavation becomes unmanageably large and renders a great deal of expense necessary. The well has to be made of an unnecessarily large diameter while the depth is quite inadequate. Again, hard rock is very frequently met with at depths below 20 to 30 feet and this has to be blasted. The ordinary workmen available in the District have very little knowledge of blasting and in such cases special workmen have to be got from elsewhere who require large advances and who very often run away. Contractors are consequently put to loss and work is delayed a great deal. Further in the case of deep wells the ordinary arrangements for bailing out water prove inefficient and inadequate with the result that deep excavation becomes impossible and a shallow well is revetted as soon as a small quantity of water is met with.

Offg *Director of Industries and Commerce in Mysore,*
Bangalore, (India).

To

The Secretary to Government,

Revenue Department,

Bangalore.

Sir,

With reference to your letter No.7460/L.B.42-16-40 of the 24th May 1917, I have the honor to state that the Musto's Boring Plant has been purchased with a view to its being eventually handed over to the President of Chitaldrug District Board for use in that District.

I have already intimated that the plant requires being experimented upon and I consider it absolutely of no advantage to hand over the Plant to the District Board without training some staff to handle the machinery.

The plant is being worked at Bangalore under my direct instructions and soon after some satisfactory results are achieved it will be despatched to Chitaldrug. Should however Government consider that the plant [redacted] be handed over first without delay to the President of the District Board, prior to attaining any results and training the staff to handle the plant, I shall lose no time in doing so.

I have the honor to be,

FROM V. Rangaswamy Iyengar, Esq., B.C.E.,
~~ALFRED CHATTERTON, Esq., F.C.S., C.I.E.~~,
Offg *Director of Industries and Commerce in Mysore,*
Bangalore, (India).

To

The Secretary to Government,

Revenue Department,

Bangalore.

SIR,

With reference to your letter No.7630 of the 31st May 1917, I have the honor to forward herewith a copy of note on Well Sinking sent to all Deputy Commissioners, for information. Separate proposals will be sent for the staff required for the work after the plant is tried for a sufficiently long time.

I have the honor to be,

S i r,

Your most obedient Servant,

V Rangaswamy Iyengar

Offg. Director.

NOTE ON WELL SINKING.

The Mustos Patent Spring Stroke Boring Plant that has now been ordered is capable of boring 4" holes in any strata such as hard rock, gravel or alluvial soils to any depth up to 250 feet. It is suitable for sinking bore holes in existing wells and in places where water yield is to be tested.

When once the probable yield and the depth at which it can be had are ascertained, arrangements may be made to start sinking a pukka well.

A fairly simple and economical way of sinking a well is by under-pinning where an excavation is first made to such a depth as the strata will allow without falling in. At the bottom of the excavation is laid a wooden curb, 3 to 4" thick whose internal diameter is equal to intended internal diameter of the well a its breadth equal to or a little greater than the thickness of the brick work. On this a cylinder of brick in surki mortar is built. In the centre of the floor is dug a pit 5 to 8 feet deep at the bottom of which is constructed a wooden platform. A number of notches are cut in the side of this pit and several props of sound bamboos or casuarina are inserted, with their lower ends butting against a foot block in bottom of pit and their upper ends against the lowest setting to support the curb with its brick-work. Then the pit is enlarged to the diameter of the cylinder. On the bottom of excavation is laid a new curb on which a new division of brick-work is built giving permanent support to the upper brickwork. The racking props are then removed and the process is repeated until the work is completed.

This method is suitable for all classes of soil. But in the case of very soft soils, another procedure may advantageously be adopted where a V shaped wooden or cement concrete curb is constructed and brickwork to a height of 3 to 4 feet over it is built on the levelled ground at which it is proposed to have a well.

The soil in the floor and under the curb is scooped out unfiformly to a depth of about 4 feet and the curb with its load of brickwork is allowed to go down or sink due to its own weight. It is very important that scooping underneath the curb should be uniformly done as otherwise uneven settlement will result.

In either case, a ~~prchable~~ portable pumping plant is necessary and I am of opinion that a pulsometer steam pump is the pump suitable for this work. This pump is capable of pumping all gritty liquids, has no other moving parts than the valves, can be easily fixed without foundations and can be hung in a well and worked while being lowered. I have herewith furnished an approximate estimate of cost of purchasing the complete plant. If all the seepage water that collects in the well, while under construction, is pumped out promptly, I do not consider any elaborate protection for the sides is necessary. A number of planks of bamboos may prove handy in emergent cases.

ESTIMATE OF PROBABLE COST OF PURCHASING A PORTABLE PUMPING PLANT FOR USE IN SINKING WELL IN THE STATE.

1.	One 6 Horse Power Semi-portable Colonial type-boiler suitable for 100 lbs.working pressure with all necessary pipes,fittings,mountings and bricks for brick lining. (lump-sum)	Rs.1350--0--0.
2.	One Pulsometer steam pump No.3.capable of pumping 4800 gallons per hour with foot valve and strainer. (lump-sum)	Rs. 420--0--0
3.	Special ½" steam hose with unions per foot for a length of 60 feet.	150--0--0
4.	Flexible 3" piping for suction 20 feet.	100--0--0
5.	" 2" " for delivery 10 with unions etc.	300--0--0
6.	½ ton differential pulley block with 100 ft. chain.	100--0--0
7.	Sundries.	50--0--0
	Total:------Rs.2470--0--0	
	or roughly Rs.2500/-
